Wait, bicycle? But
why? And what?

class="descript

MAN ON A BICYCLE ranks first in efficiency among traveling animals and machines in terms of energy consumed in moving a certain distance as a function of body weight. The rate of energy consumption for a bicyclist (about .15 calorie per gram per kilometer) is approximately a fifth of that for an unaided walking man (about .75 calorie per gram per kilometer). With the exception of the black point representing the bicyclist (*lower right*), this graph is based on data originally compiled by Vance A. Tucker of Duke University.

What would syntax highlighting for
colour-blind people look like?

```
1  include <stdio.h>
2
3  int main()
4  {
5      printf("Hello World!");
6      return 0;
7  }
```

```
1  include<stdio.c>
2
3  int main()
4  {
5      printf("Hello World!");
6      return 0;
7  }
```

```
1  include<stdio.c>
2
3  int main()
4  {
5      printf("Hello World!");
6      return 0;
7  }
```

```

What if language... were math?

function un_verify()

A function that helps us lose the `very` before a word in english.

very + determined → tenacious

very + complex → labyrinthine

very + pleasant → heavenly

very + clear → precise

It was very scary that night in the castle.

Differentiate emotions

You mention the generic word for a spectrum of emotions and then you get a selector to reach a more granular version of that emotion.

```

How can the machine infer what we need and actually help us get that done?

What if machines existed in the latent space of thought and translated them into actions?
